DRY FILM RANGE

MAG DATA GROUP's wide selection of film consists of several lines of materials all distinguished by an exceptional level of quality.

Our warehouses boast a storage capacity of **12.000 pallet spaces**, guaranteeing a constant supply of goods.

Rolls are available in all formats used in the offset and digital printing industry, as well as in special formats and lengths, thanks to our **16 production lines** that can meet all customization needs.

We offer many films certified for **direct food contact** and **sustainable solutions** based on films of natural origin or recycled resins:

Our films are also available with different types of adhesive, each with characteristics suitable for different printing technologies, both **offset and digital**.

Superdigy series film are particularly suitable for digital toner or UV printing, to achieve optimal sealing results even with high color coverages.

The multiple finishes available are designed to enhance the different types of products for which they are intended: **soft-smooth** finishes are popular in the fashion industry, while **metallized** ones find a place in the cosmetic field.

Scratch-resistant finishes or those that simulate a **linen surface** are ideal for publishing, while **sandy and rough** ones lend themselves to communication campaigns that seek a striking and original effect.

Holographic film lend themselves particularly well to the production of shoppers, stickers, figurines and game cards.

All thermal films in the Ultralen range undergo **Corona treatment** on both the outer and inner sides, where the adhesive is applied.

Some of them also undergo additional treatments to give special finishes or improve the printability of the product.

Technical specifications for each film can be found on our websites at:

www.mag-data.com and **www.ultralen.com**

For any products not listed, please contact us at:

info@mag-data.com and **info@ultralenitalia.com**.
